QUESTION:Trimming Whitespace from Input

User input often contains unintended leading or trailing spaces, which can cause incorrect comparisons or display issues if not handled.

Write

a Java program that accepts a string from the user that may contain extra spaces before and/or after the actual content, removes this extra whitespace using `trim()`, and displays the string's length and content both before and after trimming to demonstrate the difference.

Concepts: `trim()`.

JAVA CODE:

```
import java.util.Scanner;

public class Main {

    public static void main(String args[]) {

        Scanner scanner = new Scanner(System.in);

        System.out.println("Enter a string (you may add extra spaces
before/after):");

        String input = scanner.nextLine();

        String trimmed = input.trim();

        System.out.println("\n--- Before Trimming ---");

        System.out.println("Content: \"" + input + "\"");

        System.out.println("Length: " + input.length());

        System.out.println("\n--- After Trimming ---");

        System.out.println("Content: \"" + trimmed + "\"");

        System.out.println("Length: " + trimmed.length());

        scanner.close();

    }

}
```

Input:

A screenshot of a Java IDE's input field. The field is dark gray with a light gray border. The text 'HELLOWORD' is entered in all caps. Above the field, the word 'Input' is written in a small, light gray font.

Output:

Your Output

Enter a string (you may add extra spaces before/after):

--- Before Trimming ---

Content: " HELLOWORD"

Length: 16

--- After Trimming ---

Content: "HELLOWORD"

Length: 9
